

Project Overview

Property Name: Hale Ōhi'a Lehua

Island: Hawai'i Island

Visitor Segment: Eco-tourists (Researchers/Visitors)

Hale Ōhi'a Lehua is located on the edges of a Ōhi'a forest on Hawai'i Island near Volcanoes National Park. The property is designed to serve two types of visitors: Research Guests who are drawn to Kīlauea for academic or professional pursuits and Leisure Guests who are attracted to Hale Ōhi'a due to its proximity to an active volcano and the unique workshops and opportunities provided by the property. I drew inspiration from the concept of Two-Eyed Seeing, which seeks to balance equally Western science and Indigenous knowledge, which I hope to reflect in the structure and presentation throughout the site.

The three pages are:

Marketing Page – the landing page that serves as an introduction to the property. Covers philosophy, and a snapshot of current conditions in Volcano National Park

Visitor Dashboard – More in-depth real-time conditions, activity suggestions, and event information

Admin Page – Interface to manage events, bookings, partner information, and adjust condition display information if needed or desired

User Personas

1. The Research Guest: These guests are coming specifically to engage with the volcano. This could be a scientist, a writer, a Hawaiian practitioner, or anyone with an academic and/or professional reason to visit Kīlauea.
2. The Leisure Guest: These guests are drawn to some aspect or offering of Hale Ōhi'a Lehua. Maybe they are intrigued by the workshops provided, or the hosted guest speaker events. It could be the amenities, proximity to forest and volcano hikes, or desire to be near others travelling for more particular reasons.
3. Property Admin: Uses the Admin Page to update event and workshop schedules, process booking and respond to inquiries, change/manage/update partner destination information, and ensure that the current volcano conditions are displaying as desired.

Marketing Page Requirements

Hero: This is to give a first impression of the page. I'd like it to have a dynamic background with media that reflects the current conditions of the volcano's activity (erupting, smoldering, dormant) along with a rotating 'Ōlelo No'eau quote.

About: Short description illustrating the property's Two-Eyed Seeing principle of equally valuing scientific and indigenous ways of thinking. Highlights proximity to crater, the curated speaker and workshop series, and resources available for both leisure and research support.

Amenities:

- Shuttle to the crater provided as well as protective gear if needed (masks, eye protection, hats, ponchos, etc)
- Workshop attendance included in accommodation price
- On-site restaurant serving farm-to-table breakfast, lunch, and dinner
- Late night lounge offering beverages and pupus – open till 10
- Clearly demarked trails through Ohi'a forest offering different ranges of time/difficulty to complete
- Complimentary laundry service
- On-site cold plunge, hottub, and sauna
- Accommodations ranging from single rooms to connected suites
- In the event of unfavorable crater conditions, shuttle services provided to select partner destinations and/or discounted car rentals available for daily/weekly rates.
- Dedicated Research Rooms available for per-hour booking

Conditions: Provide real-time information about current conditions on Kīlauea, with plain-language explanations for guests. Links through to a full Visitor Dashboard with more in-depth details.

Calls To Action: Either “Book a Stay” targeting Leisure guests, or “Plan a Research Visit” targeting Research Guests.

Component Hierarchy Diagram

Data Flow

Currently in Week 12 the property data is hardcoded as a props object in App.jsx and passed down to child components via prop drilling.

Going forward, my plan is...:

1. MongoDB stores the property documentation (name, description, amenities)
2. Express routes via GET /properties/:id
3. React frontend uses useEffect and fetch() to request data from the Express API
4. App.jsx holds the response in state and passes it down to the child components
5. USGS HVO API supplies real-time Kīlauea alert level data to HeroSection and ConditionsSnapshot, driving the dynamic background media and plain-language condition summaries.

Acceptance Criteria

1. Given the marketing page has loaded, when a user clicks “View Full Conditions”, then they are redirected to the Visitor Dashboard displaying current conditions in Volcanos National Park as well as any Kīlauea alert statuses.
2. Given the marketing page has loaded, when a user clicks on “Plan a Research Visit”, they are then redirected to a page describing resources/amenities specifically geared towards those visiting with a specific purpose
3. Given the marketing page has loaded, when a visitor clicks on “Book a Stay” they are then redirected to a page describing resources/amenities specifically geared towards leisure visitors
4. Given the marketing page has loaded, when the hero section renders, then it offers visuals that mirror current conditions on Kīlauea
5. Given the marketing page has loaded, when the hero section renders, then a quote fades in before settling into it’s position in the hero section
6. Bonus: Livestream of the volcano either hosted directly on the site or clearly linked
